

SETUP UPDATES

Hey everyone

I'm happy to share that the V1 specification of the Zandvoort setup is now complete.

Zandvoort Setup Changes

For Zandvoort, the priority was improving the car's natural rotation while maintaining strong rear stability and maximising straight-line performance.

To achieve this, the rear wing has been reduced to improve top speed on the straights. Rear suspension stiffness has also been increased, allowing the car to rotate more naturally throughout the lap while maintaining a stable rear platform.

To complement these changes, the rear anti-roll bar has been increased to further improve the car's rotation through the slower and medium-speed corners. Finally, the rear tyre pressures have been increased to improve tyre temperature management. More consistent rear tyre temperatures help provide a more stable rear axle, giving the car a predictable balance over a race distance.

Overall, the result is a car that rotates more naturally while maintaining strong rear stability and improved straight-line performance.

Wishing you all a great day :)
